

Expanded Mark Scheme – T-Level Example Mock 1

Q	Expanded Answer Guidance	Marks
1a	$1_{ft} = 0.3048_m$ $12_{ft} = 12 * 0.3048_m$ $12_{ft} = 3.6576_m$	1
1b	Reasons for conversion: <ul style="list-style-type: none"> • Standardisation • Avoids engineering errors • SI units are standard in engineering • To make sure the beam fits the design • To ensure structure is built safely • To match engineering drawings 	1
2a	$\vec{A} = 6i + 2j$ $\vec{B} = 3i + 5j$ $\vec{R} = (6 + 3)i + (2 + 5)j$ $\vec{R} = 9i + 7j$	1
2b	Magnitude: $ R = \sqrt{9^2 + 7^2} = 11.40175425$ Angle: $\tan^{-1}\left(\frac{7}{9}\right) = 37.87498365$ $\vec{R} = 11.402 \angle 37.875$	1 mark for magnitude
	Note: Carry on marks are allowed if wrong answer is got in part a but correct method is used Magnitude and angle marks are for method rather than result	1 mark for angle
		1 mark for answer
2c	<div style="display: flex; align-items: flex-start;">  <div style="margin-left: 20px;"> <p>Note: the 9 across and 7 up do not have to be drawn or written, they are just there to show how to draw it</p> <p>Carry on marks are allowed if wrong answer is got in part a or b but line is correctly drawn and labelled</p> </div> </div>	<p>1 mark for drawing the line</p> <p>1 mark for including correct labels</p>

3a	<p>Parallel resistance: $\frac{1}{\frac{1}{120} + \frac{1}{300}} = 85.71428571$</p> <p>Series resistance: $85.71428571 + 560 = 645.7142857$</p>	<p>1 mark for method</p> <p>1 mark for answer</p>
3b	<ul style="list-style-type: none"> • Ammeter • Connected in series <p>Accept:</p> <ul style="list-style-type: none"> • Multimeter 	2
3c	<p>$V = IR$</p> <p>$10 = 645.7142857I$</p> <p>$I = \frac{10}{645.7142857} = 0.01548672566A$</p> <p>$0.01548672566A = 15.486mA$</p> <p>Carry on marks are allowed if wrong answer is got in part a but correct method is used</p>	1
4a	<p>Gear ratio: $\frac{\text{teeth on driven}}{\text{teeth on driver}} = \frac{60}{20} = 3$</p>	1
4b	<p>$\text{Output Speed} = \frac{\text{input speed}}{\text{gear ratio}} = \frac{900}{3} = 300$</p> <p>Carry on marks are allowed if wrong answer is got in part a but correct method is used</p>	2
5a	<p>Iron core:</p> <ul style="list-style-type: none"> • Increases permeability • Concentrates magnetic flux • Strengthens magnetic field • Iron core is a magnetic material • Iron is ferromagnetic 	2 marks, 1 for each point raised
5b	$H = \frac{NI}{L}$ $H = \frac{500 * 2}{0.25} = 4000A/m$	<p>1 mark for method</p> <p>1 mark for answer</p>
5c	<p>Ways to improve field strength:</p> <ul style="list-style-type: none"> • Increase current • Increase turns • Better core material • Reduce solenoid length 	2

6a	<p>Electrical conduction requires:</p> <ul style="list-style-type: none"> • Free charge carriers • Electrons able to move • Delocalized electrons • A potential difference is applied (voltage) meaning current flows 	2
6b	<p>Valence band:</p> <ul style="list-style-type: none"> • Electrons are held/bound to atoms <p>Conduction band:</p> <ul style="list-style-type: none"> • Electrons are free to move and contribute to conduction <p>Conductor:</p> <ul style="list-style-type: none"> • No/small band gap • Band gaps overlap • Conduction band is partially filled • Electrons move easily <p>Semiconductor:</p> <ul style="list-style-type: none"> • Small band gap • Electrons can gain enough energy and become delocalized • Conductivity with energy <p>Insulator:</p> <ul style="list-style-type: none"> • Large band gap • Very few electrons can become delocalized • Poor conductivity 	5
6c	<p>Silicon:</p> <ul style="list-style-type: none"> • Is a semiconductor • Gains energy from heat/light • Electrons move to conduction band from the valence band • More free charge carriers due to electrons in the conduction band • Electrons leave holes which act as positive charge carriers • Conductivity increases 	4

<p>7a</p>	<p>Indicative content:</p> <p>Hydraulics:</p> <ul style="list-style-type: none"> • Hydraulics use hydraulic fluid to perform actions with pumps pushing fluid around • Hydraulics are good for heavy lifting • Hydraulics could leak and contaminate biscuits, packaging, machinery and work surfaces. • Hydraulic fluid near food creates hygiene and cleaning issues • Hydraulics may be excessive for lightweight biscuit trays • Hydraulics require maintenance such as checking seals, hoses, pumps, filters and fluid levels <p>Pneumatics:</p> <ul style="list-style-type: none"> • Pneumatic systems use air to perform actions with compressors needed to compress the air • Pneumatics are good for fast, repetitive movements • Pneumatics are cleaner than hydraulics but would need air quality checks like filters and dryers • Pneumatics are good for food processing as leaks are usually less hazardous than hydraulic fluids • Pneumatics are often less precise than electrical systems due to air compressibility <p>Electrics:</p> <ul style="list-style-type: none"> • Electrics use current to perform actions and need voltage sources to perform actions • Electric actuators are good for accurate positioning, controlled speed, rotary motion and repeatable movement. • No risk of contamination of food • Risk from overheating, sparks or other faults causing fires with cardboard packaging • Easier to control with a controller like PLCs or Microcontrollers <p>Conclusion:</p> <ul style="list-style-type: none"> • A strong answer may include a mixed system with hydraulic actuators for fast linear actions and electric actuators for precise motion <p>Band 1 (1–3):</p> <ul style="list-style-type: none"> • Basic comparison <p>Band 2 (4–6):</p> <ul style="list-style-type: none"> • Clear pros/cons • Some application to biscuit facility <p>Band 3 (7–9):</p> <ul style="list-style-type: none"> • Detailed engineering comparison • Discusses cleanliness, safety, maintenance, efficiency • Justifies suitable option 	
-----------	--	--

<p>8a</p>	<p>Indicative content:</p> <p>PLCs:</p> <ul style="list-style-type: none"> • A PLC is designed for industrial automation and continuous operation. • PLCs are suitable for systems with many inputs/outputs such as an airport conveyor and screening system • PLCs are easier to fault find because the technician can monitor the program, I/O and diagnostic messages • PLCs are more suited for safety critical systems which the scenario is • PLCs are expandable if the airport needs extra conveyors or screening equipment. • PLCs are more expensive than microcontrollers but the cost is justified <p>Microcontrollers:</p> <ul style="list-style-type: none"> • Microcontrollers are much cheaper, compact and useful for embedded systems • Could fit in the smaller modules eg barcode scanners, sensor units or displays • A microcontroller would need a lot of additional components to meet the requirements of a full baggage system • Usually much harder to maintain and troubleshoot <p>Conclusion</p> <ul style="list-style-type: none"> • A strong answer may suggest a dual control system with PLCs for the main control and microcontrollers used for smaller parts <p>Band 1 (1–3):</p> <ul style="list-style-type: none"> • Basic PLC vs microcontroller comparison <p>Band 2 (4–6):</p> <ul style="list-style-type: none"> • Reliability, diagnostics, industrial suitability <p>Band 3 (7–9):</p> <ul style="list-style-type: none"> • Detailed industrial comparison • Maintenance, uptime, expandability, troubleshooting • Justifies best option 	<p>9</p>
-----------	--	----------

<p>9a</p>	<p>Indicative content:</p> <p>Sensors:</p> <ul style="list-style-type: none"> • System might use a camera for detecting approaching visitors • System might use an encoder to determine where the head had turned to • System might use a limit switch to determine when the head has reached a position • System might use an ultrasonic sensor to detect how close a visitor is • System might use a light gate to determine when a visitor is approaching or too close <p>Actuators:</p> <ul style="list-style-type: none"> • System might use a servo or other motor type to control the head movement • System might use LEDs to light up the eyes • System might use a speaker to play the roar sound • System might use linear actuators to raise the arm / jaw <p>Sequence:</p> <ul style="list-style-type: none"> • Describes a sensible sequence, for instance: <ul style="list-style-type: none"> - visitor detected - safety zone checked - eyes turn on - head turns - jaw opens - roar sound plays - arm moves - jaw closes - arm and head return to home position - system resets when visitor leaves <p>Safety:</p> <ul style="list-style-type: none"> • Describes how movement should stop when someone enters zone <p>Controller:</p> <ul style="list-style-type: none"> • System might use a PLC, Computer or Microcontroller to control its movement • Sufficient consideration has been put into what controller to use <p>Band 1 (1–4):</p> <ul style="list-style-type: none"> • Basic system design, some consideration into sensors, actuators <p>Band 2 (5–8):</p> <ul style="list-style-type: none"> • Suitable sensors/actuators • Some operation and safety <p>Band 3 (9–12):</p> <ul style="list-style-type: none"> • Full system design • Appropriate sensors and actuators and controller • Clear sequence • Strong safety considerations • Diagrams integrated with explanation 	<p>12</p>
